Outline

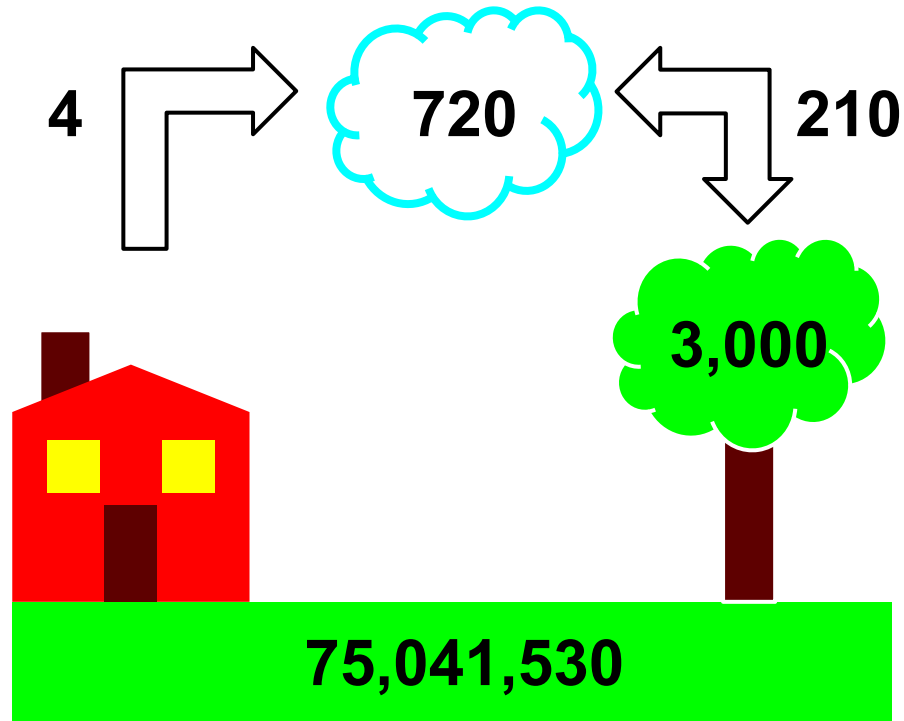

Chapter 1: Introduction

Chapter 2: Resource Sharing Controls Gene Expression Bursting

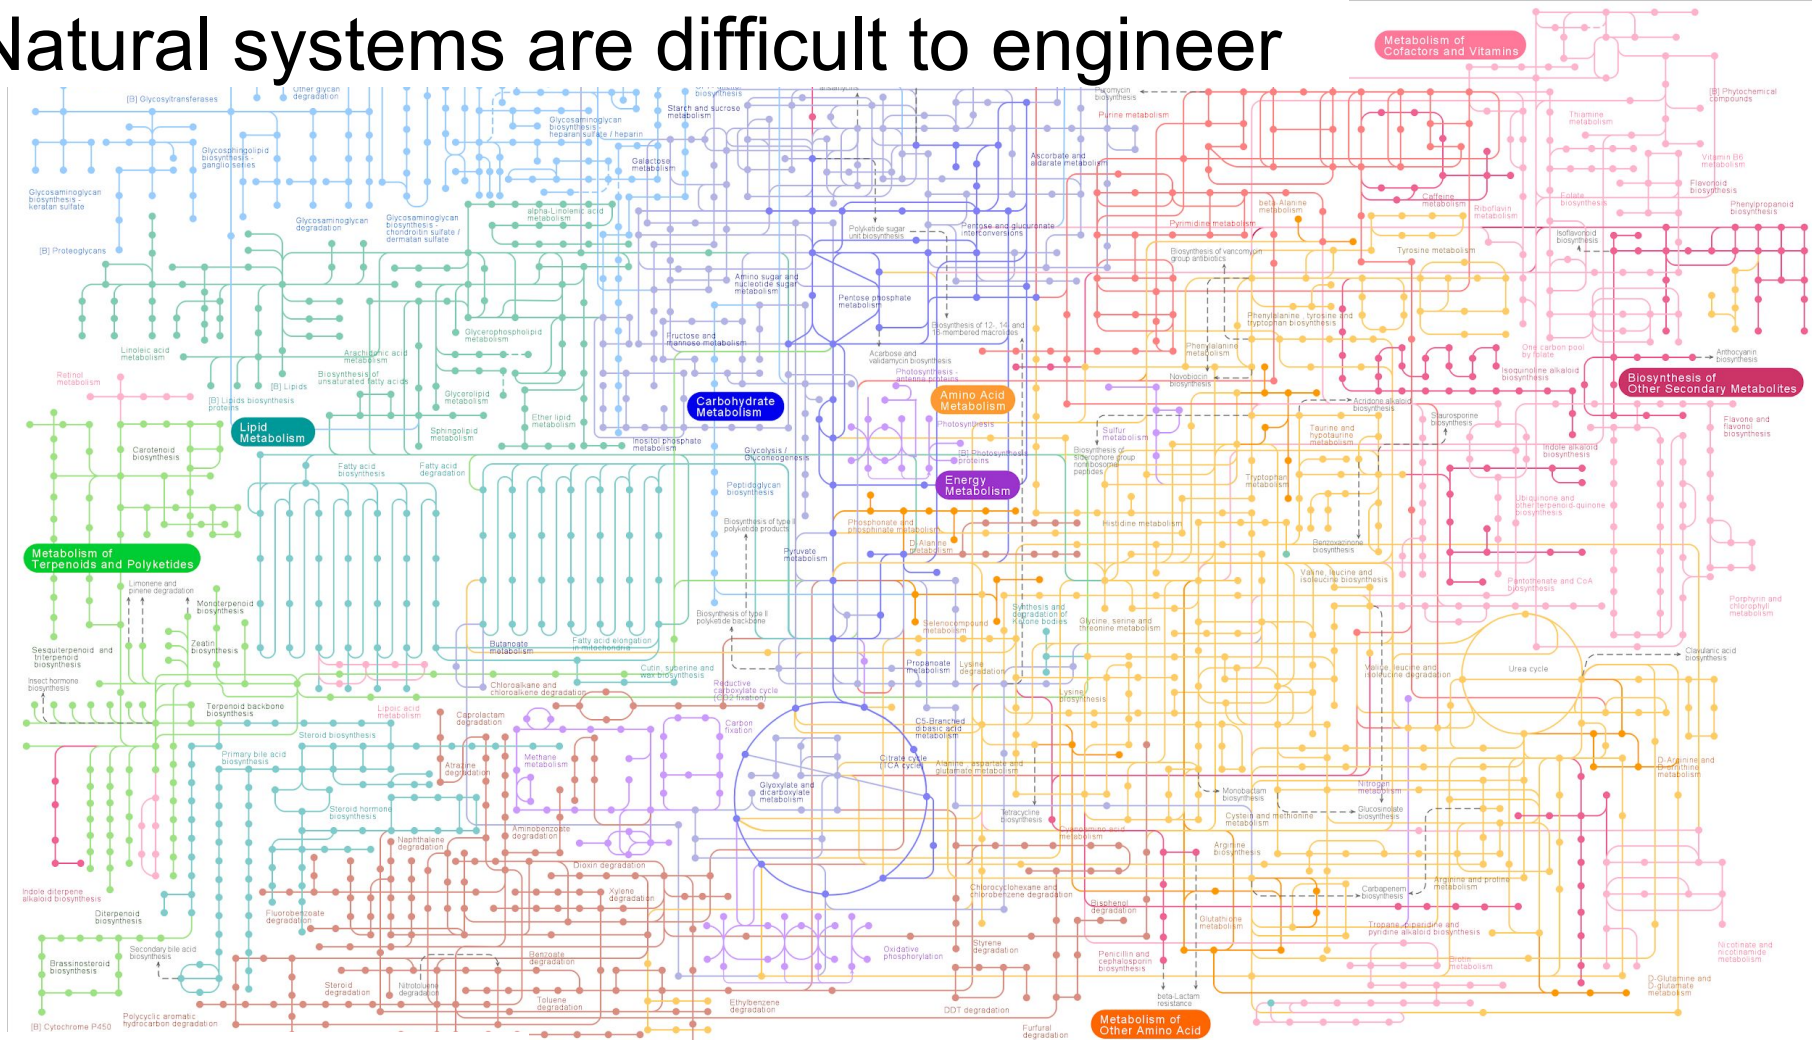

Chapter 3: Controlling Cell-Free Gene Expression Behavior by Tuning Membrane Transport Properties

Chapter 4: Conclusion

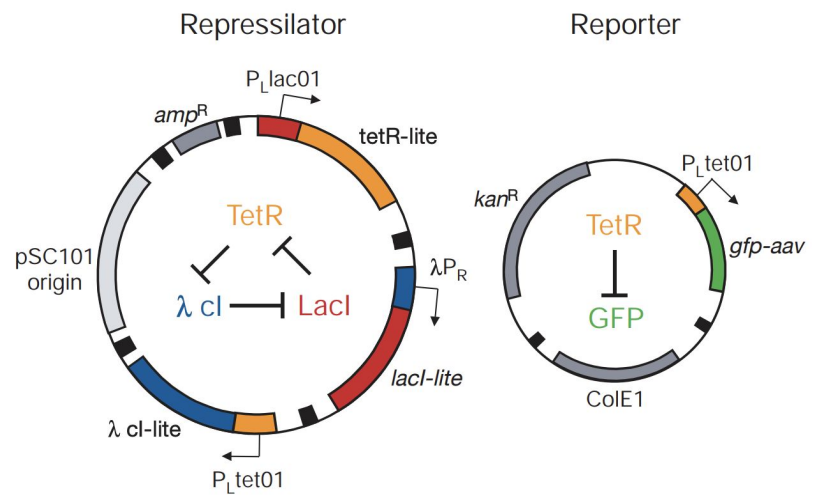

Biology offers many solutions to energy challenges

Natural systems are difficult to engineer

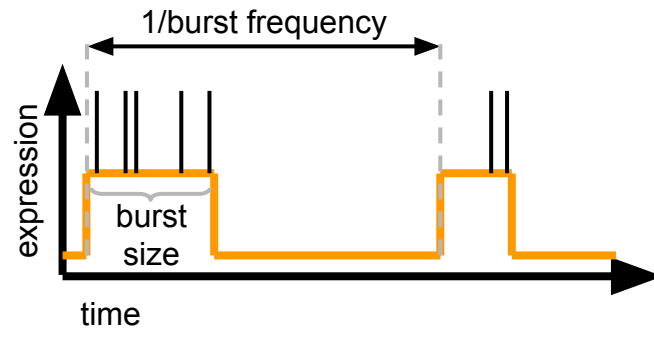

Biological systems are designed as circuits

Gene expression is a noisy process

Expression bursting further contributes to noise

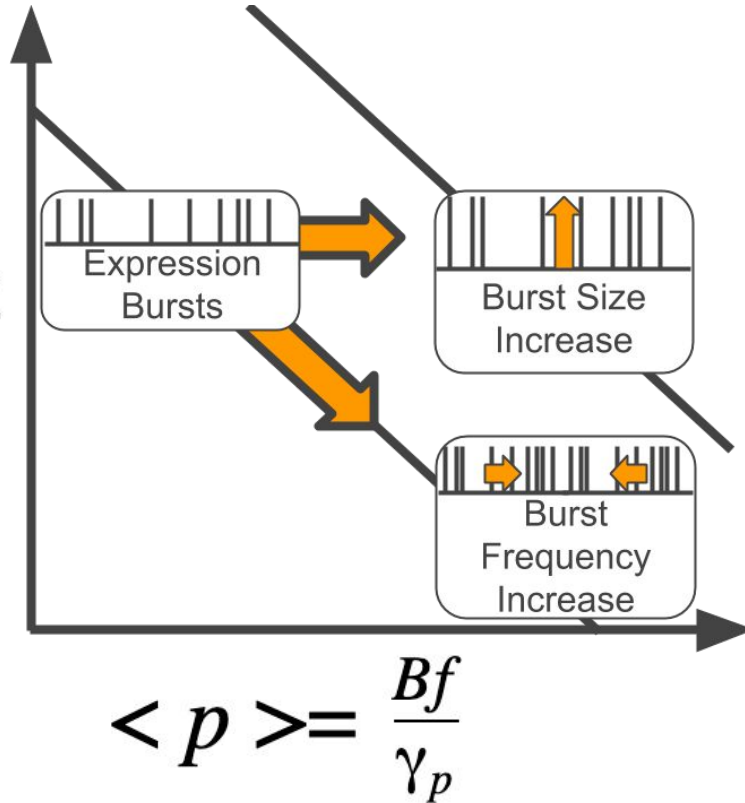

$$\langle p \rangle = \frac{Bf}{\gamma_p}$$

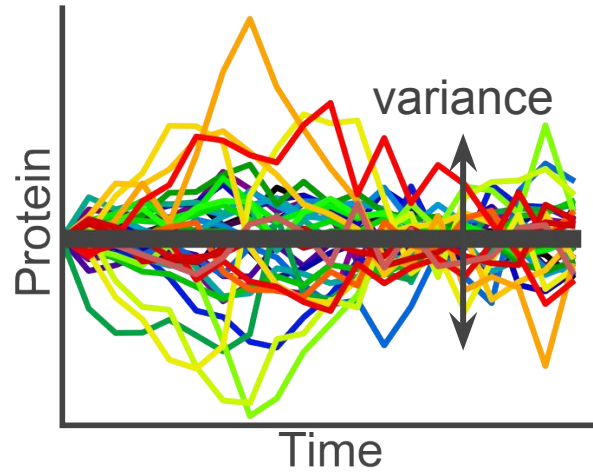

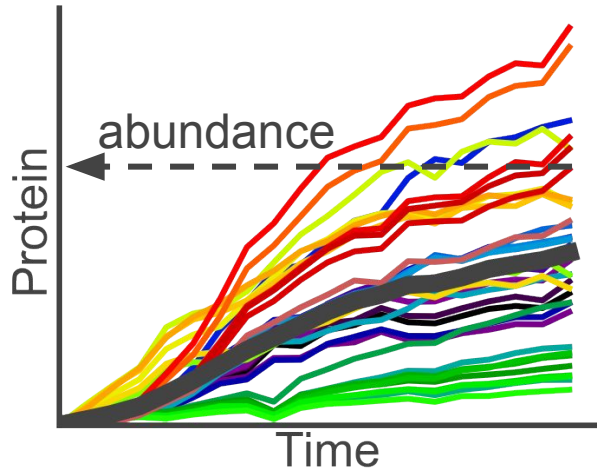

$$CV^2 \simeq \frac{\gamma_p}{f}$$

Burst size and frequency changes are measurable from protein expression data

$$CV^2 \simeq \frac{\gamma_p}{f}$$

Protein abundance and variance of noise are key measures

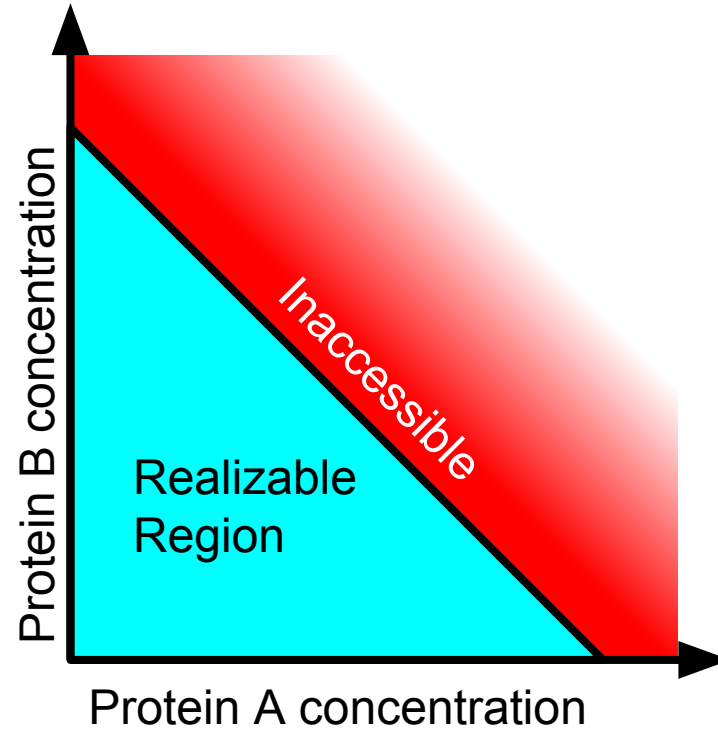

Protein expression requires resources

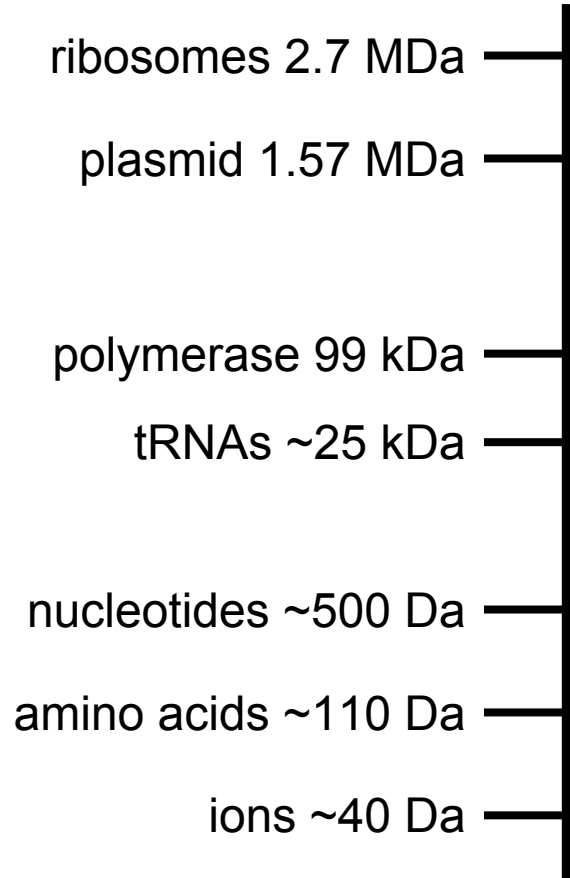

Expression resources are shared between genes

Resource sharing influences protein expression

expression resources

Cell-free protein expression systems allow fine control of the expression environment

Microfluidic confinement of protein expression to cell-relevant volumes

Purpose

The purpose of this dissertation is to investigate how gene expression bursting and variation is affected by expression resources being shared among genes.

1. How are gene expression characteristics altered by the size of resource pools?
2. Can membrane permeability be tuned to enhance gene expression?
3. How are the dynamics of gene expression affected by resource transport across permeabilized membranes?

Outline

Chapter 1: Introduction

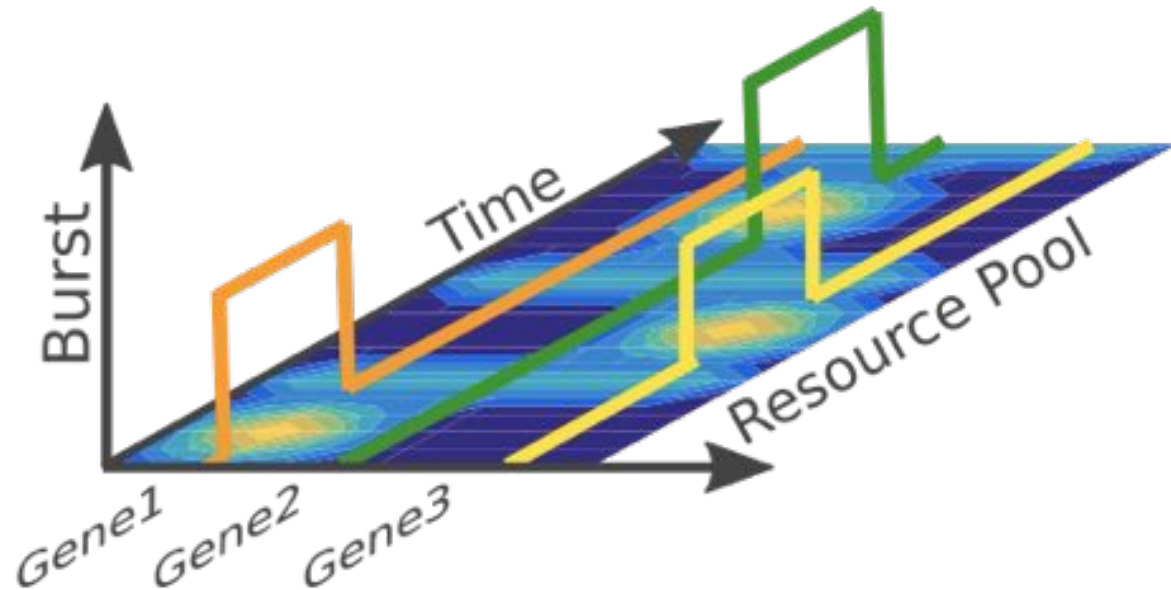

Chapter 2: Resource Sharing Controls Gene Expression Bursting

Chapter 3: Controlling Cell-Free Gene Expression Behavior by Tuning Membrane Transport Properties

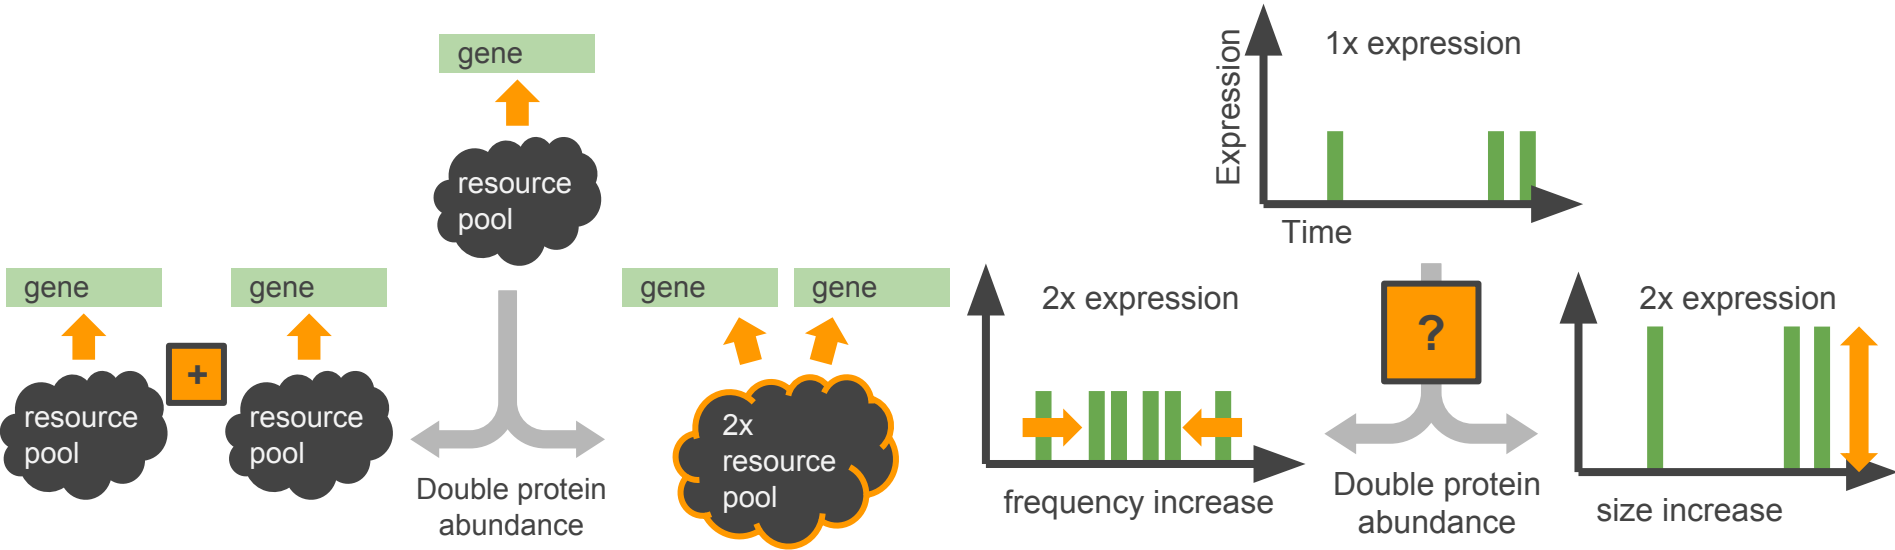

Chapter 4: Conclusion

Chapter 2: Resource Sharing Controls Gene Expression Bursting

Bursty expression and resource sharing are linked

How does resource sharing affect bursty expression?

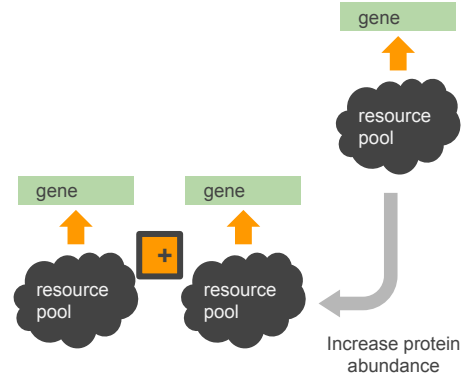

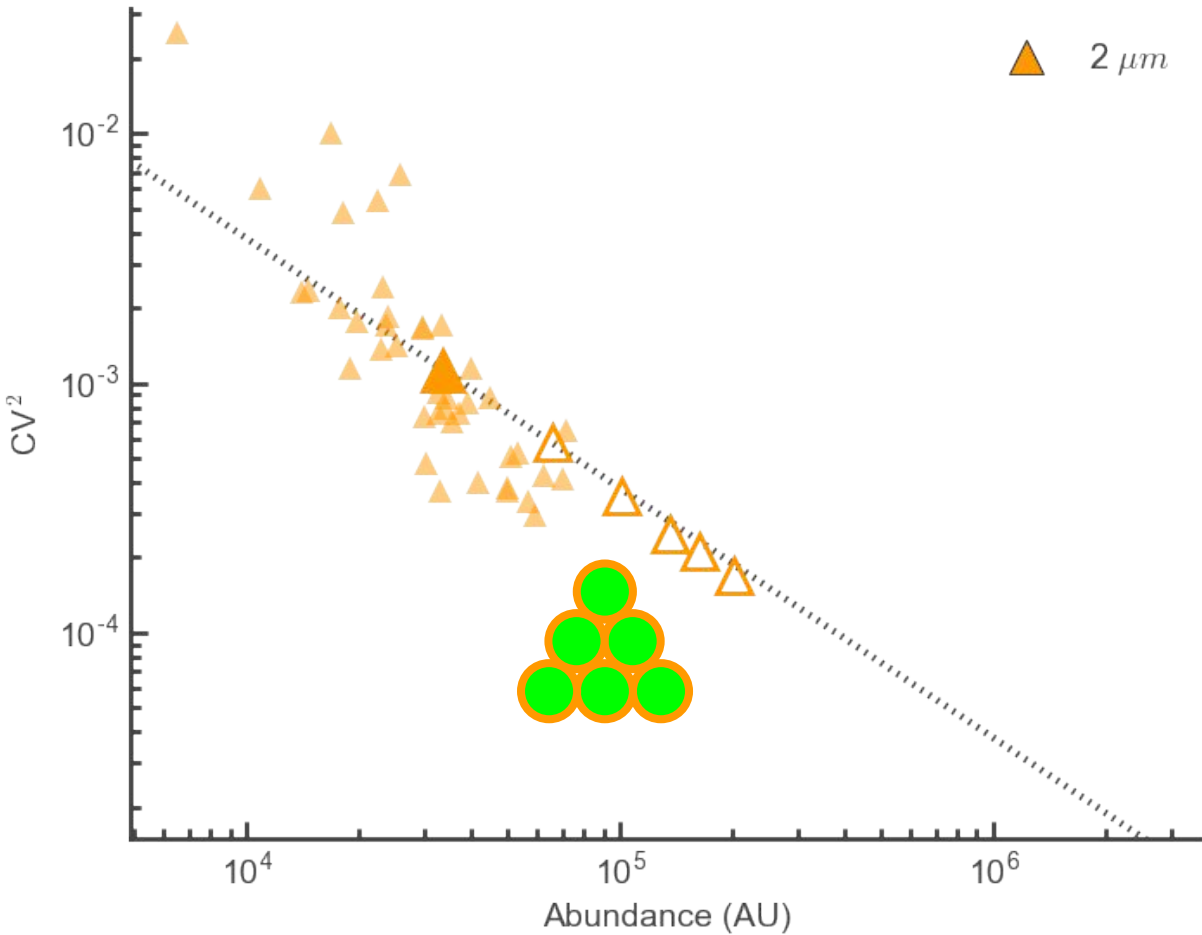

Burst size and frequency changes are measurable from protein expression data

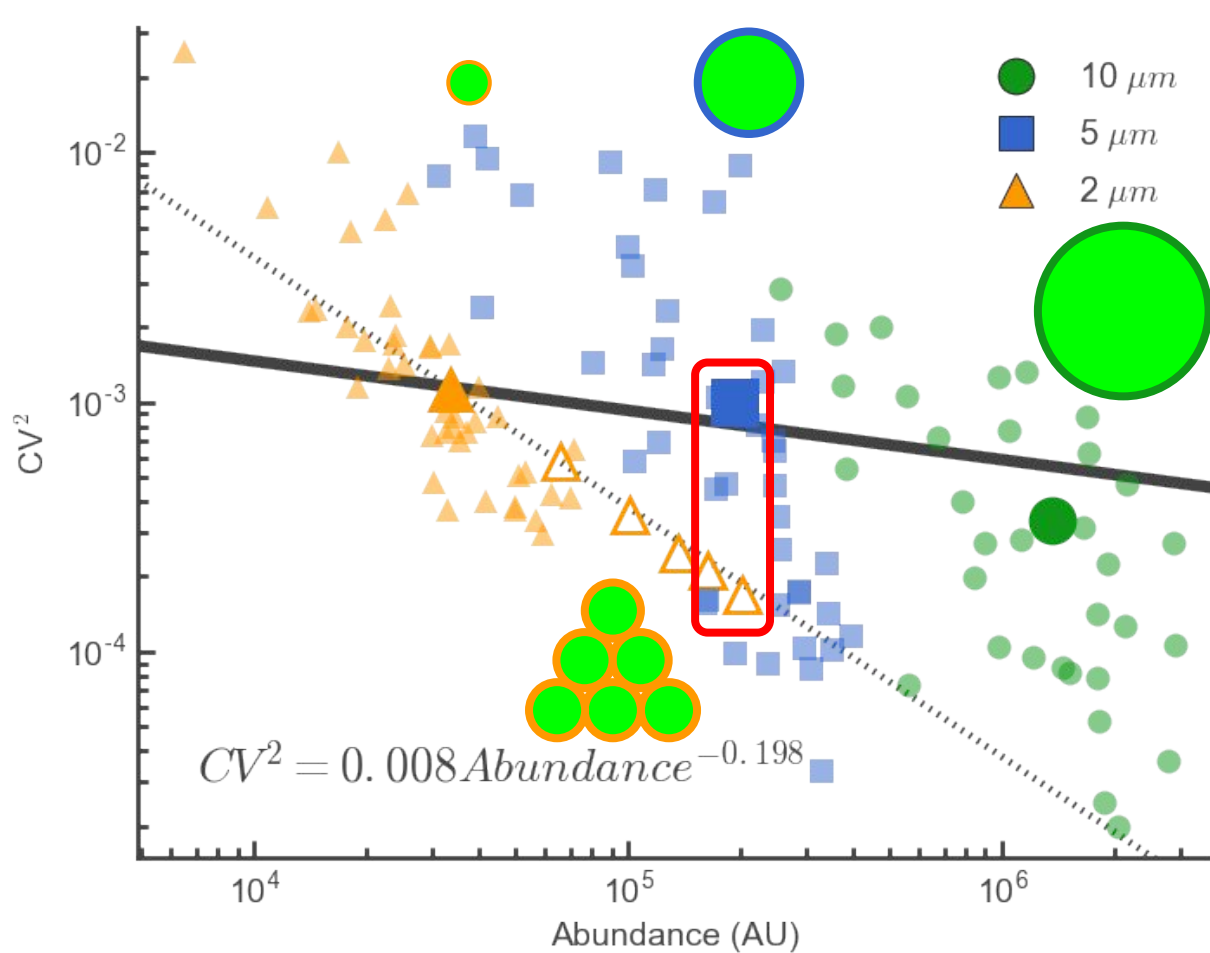

Karig, D. K., Jung, S. Y., Srijanto, B., Collier, C. P., & Simpson, M. L. (2013)
Sun, Z. Z., Hayes, C. A., Shin, J., Caschera, F., Murray, R. M., & Noireaux, V. (2013)

Divided resource pools increase burst frequency

Larger chamber size result in larger burst size

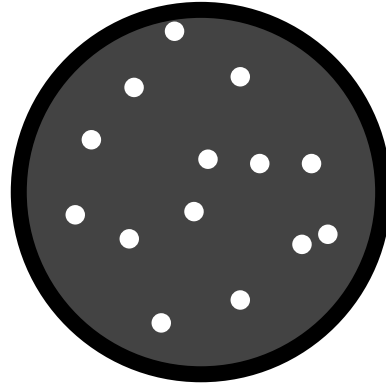

Burst frequency variation of expression centers

Low

High

Burst size variation of expression centers

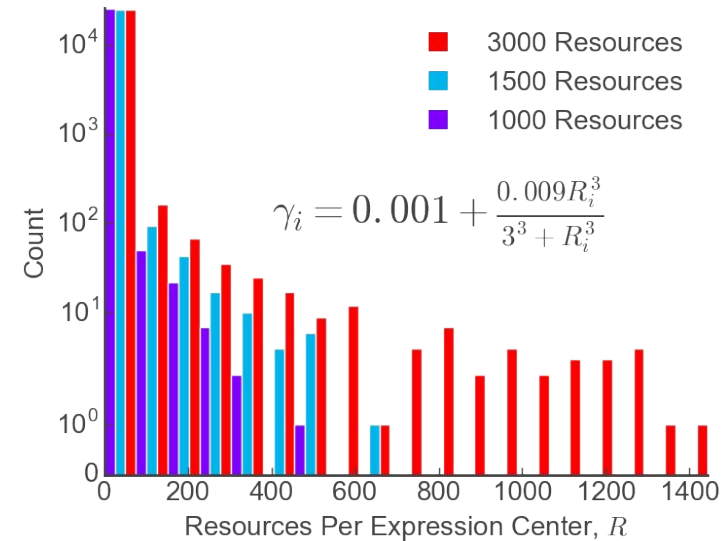

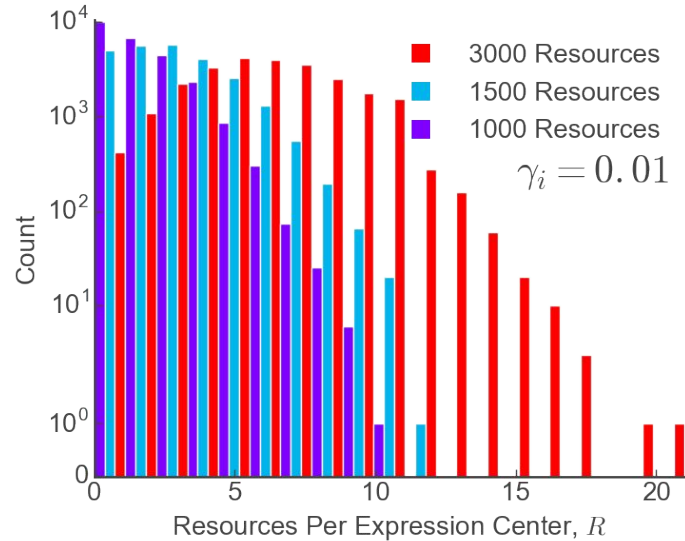

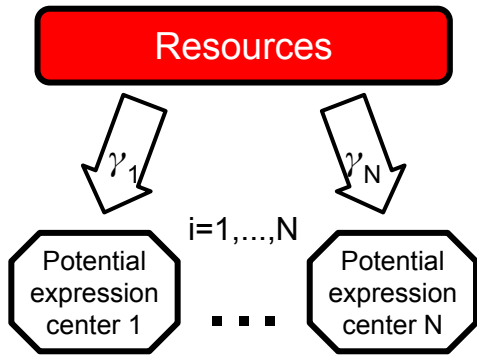

Low

High

Cooperativity in resource allocation reinforces large bursts instead of creating new bursts

Summary Chapter 2

- Larger shared resource pools result in larger burst size but relatively constant burst frequency
- Larger divided resource pools resulted in larger burst frequency but constant burst size
- Resources are added to existing bursts instead of nucleating new bursts

Outline

Chapter 1: Introduction

Chapter 2: Resource Sharing Controls Gene Expression Bursting

Chapter 3: Controlling Cell-Free Gene Expression Behavior by Tuning Membrane Transport Properties

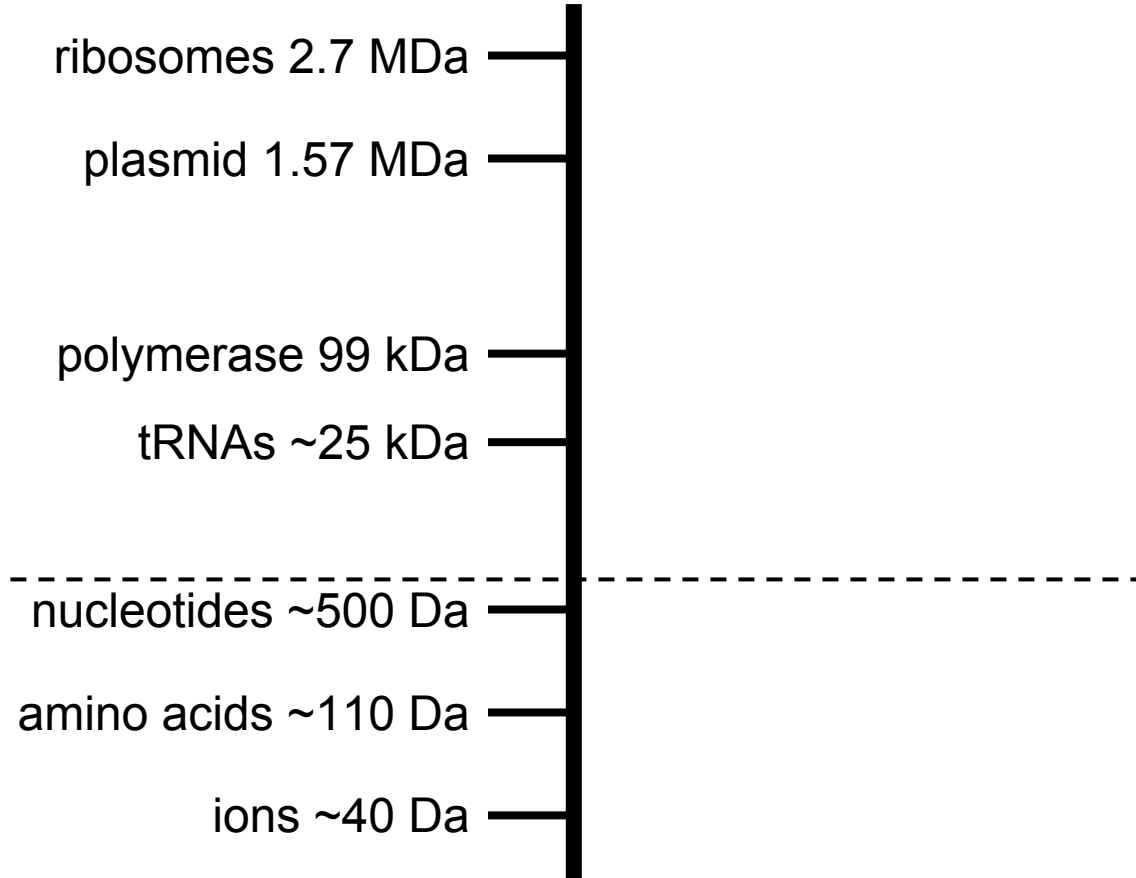

Chapter 4: Conclusion

Chapter 3: Controlling Cell-Free Gene Expression Behavior by Tuning Membrane Transport Properties

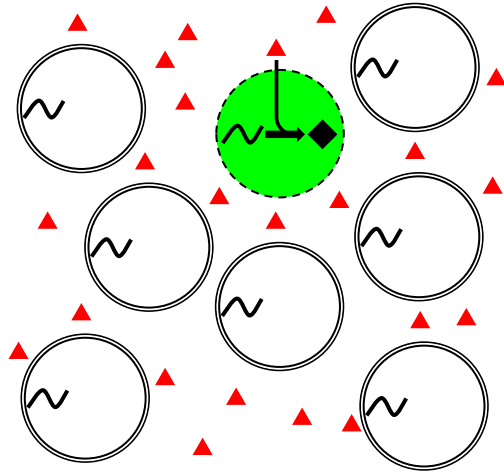

A small fraction of vesicles are permeable to small, charged expression resources

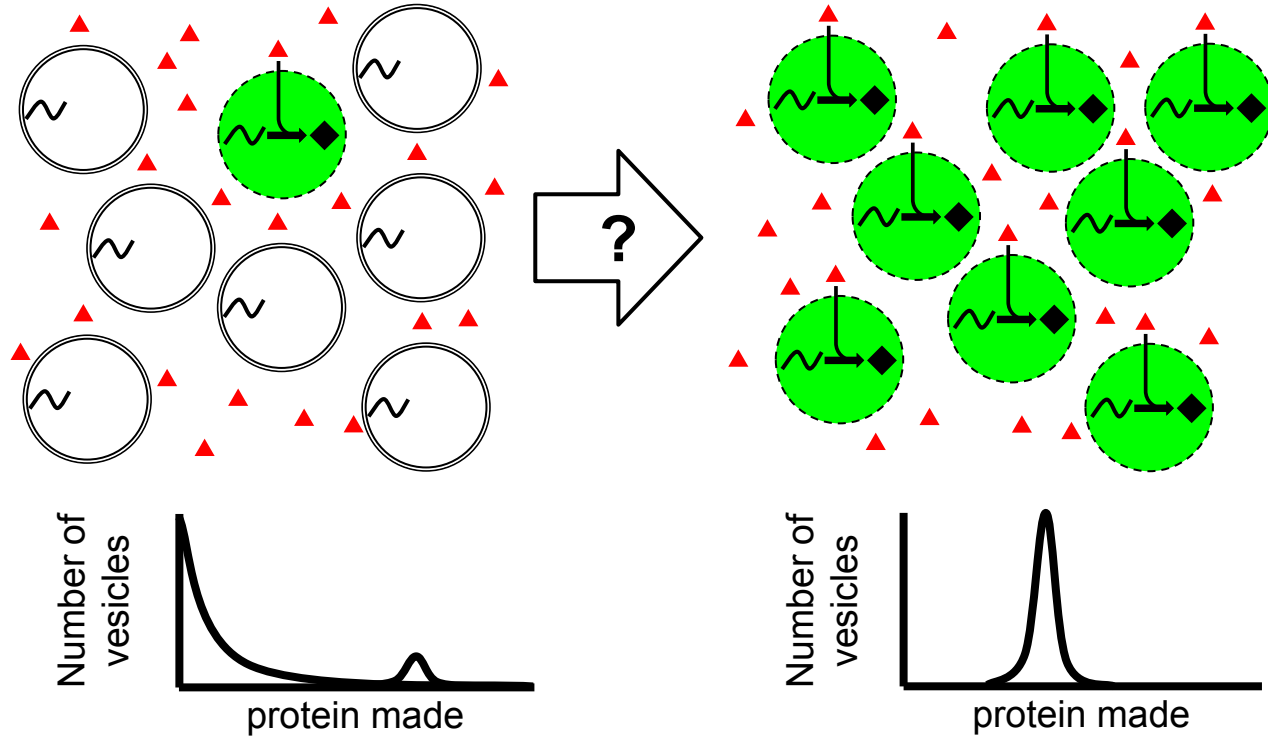

expression resources

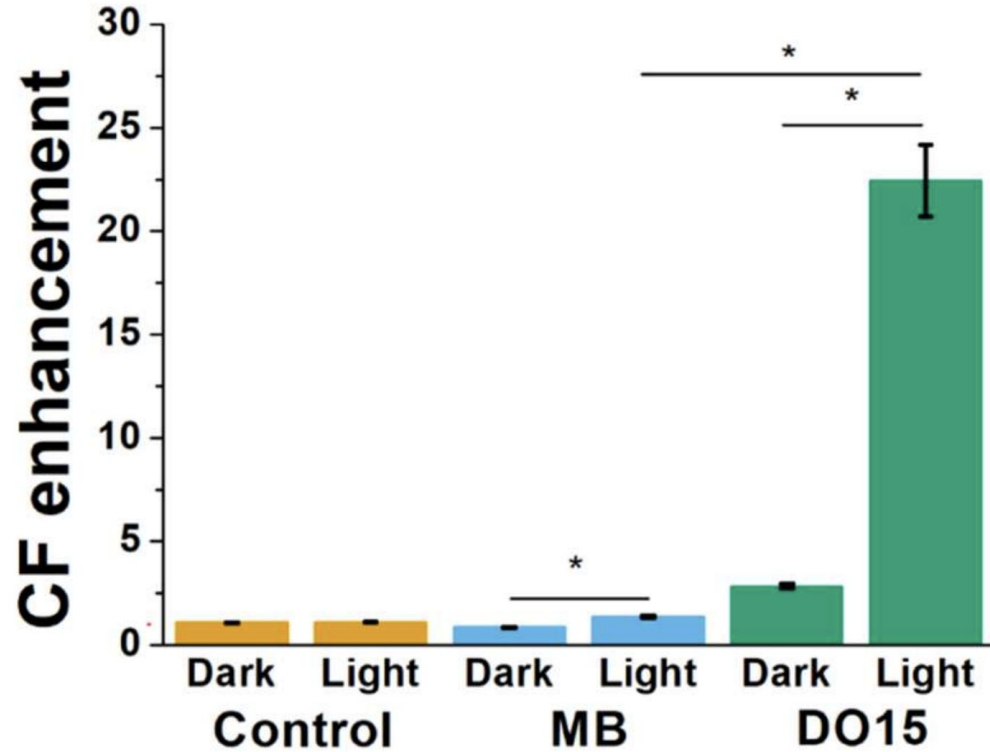

Few vesicles are permeable to expression resources

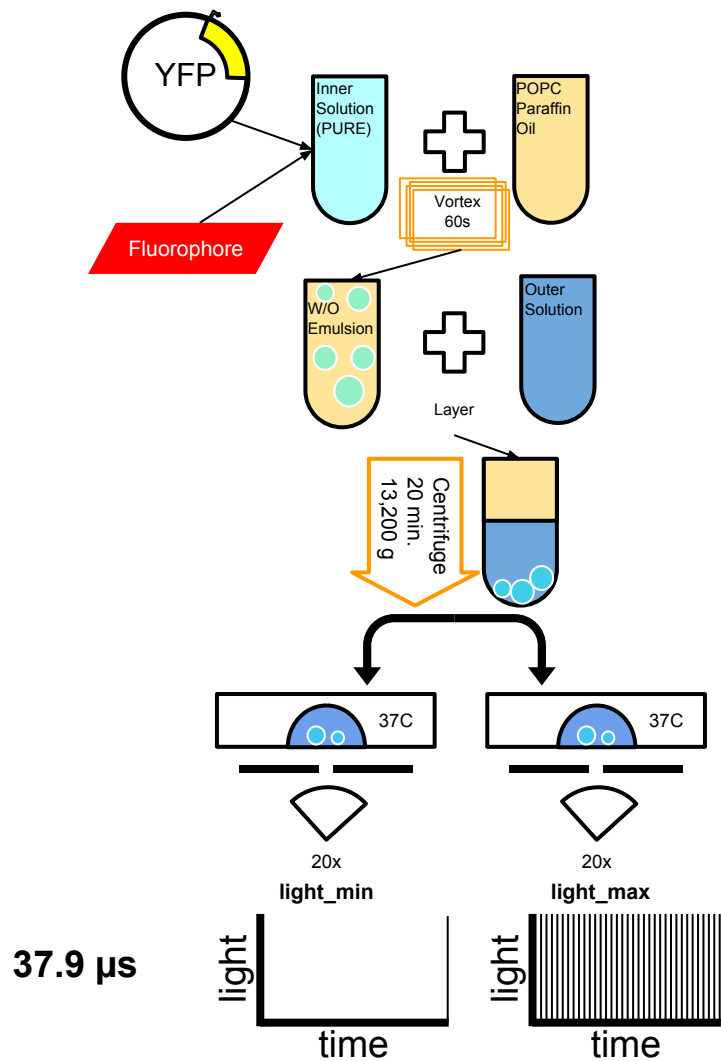

Can most vesicles be made permeable?

Photosensitized membrane have increased permeability

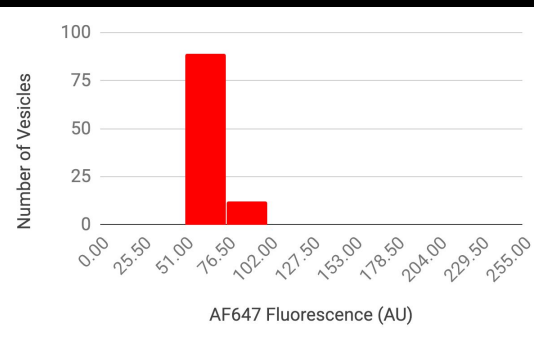

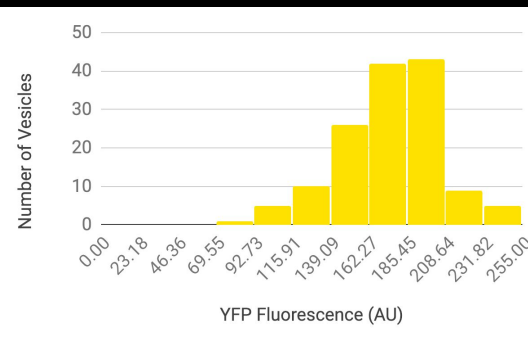

- Zeiss, LSM 710 confocal laser scanning microscope
- Z-stacks of ~23 slices were taken every 3 minutes for 2 hours
- slice was 512x512 pixels
- 405 nm, 6.5 mW; 488 nm, 6.1 mW; and 633 nm, 1.67 mW lasers
- Pixel = **0.81 μ m x 0.81 μ m**
- Laser dwell time per pixel every three minutes **37.9 μ s**

Small molecules cross permeabilized membranes while large molecules do not

expression resources fluorophores

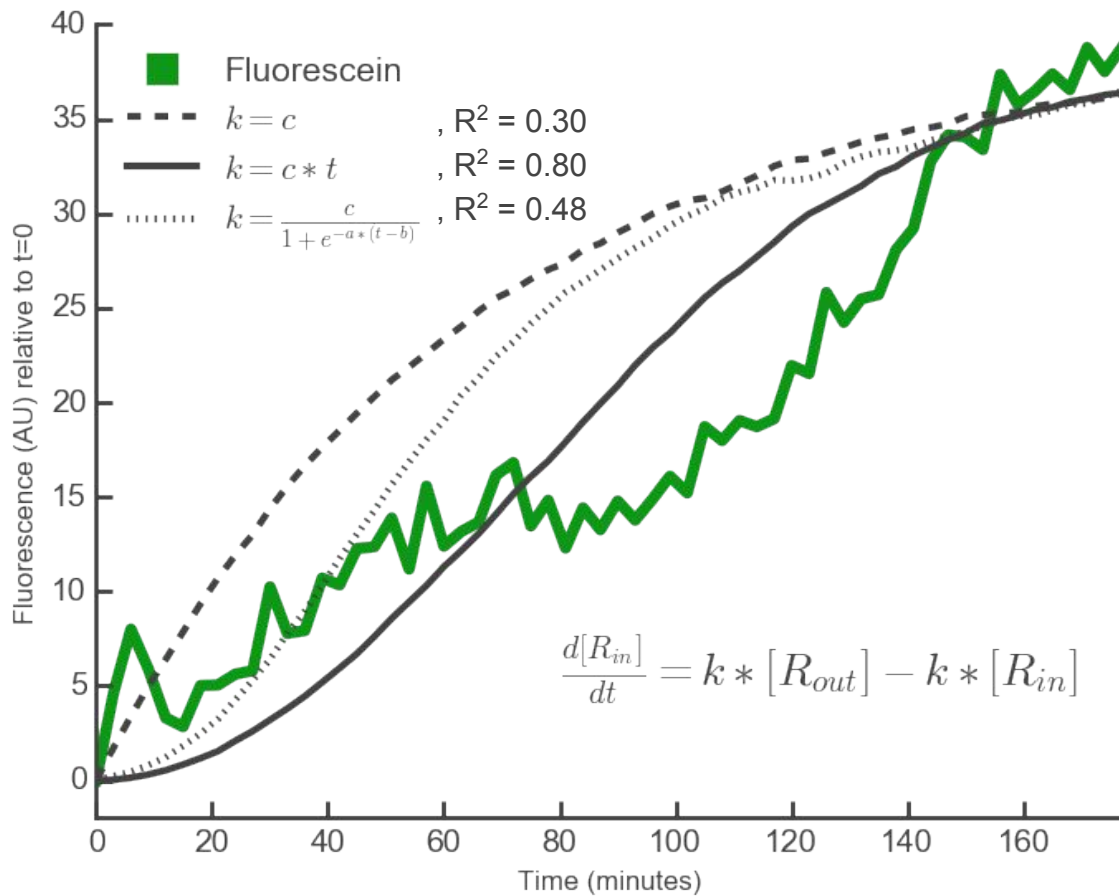

How does membrane permeability change during light_max?

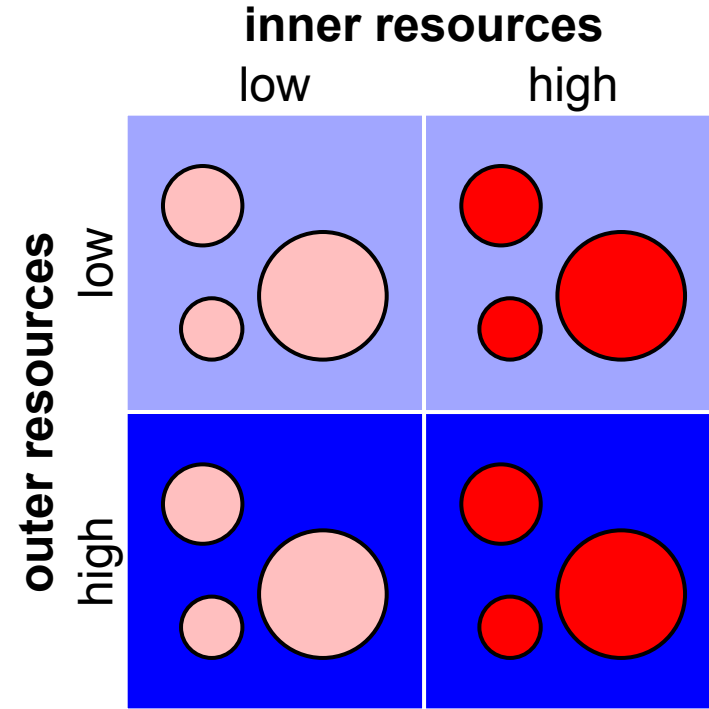

$$\frac{d[R_{in}]}{dt} = k * [R_{out}] - k * [R_{in}]$$

Membrane permeabilization increases linearly with time

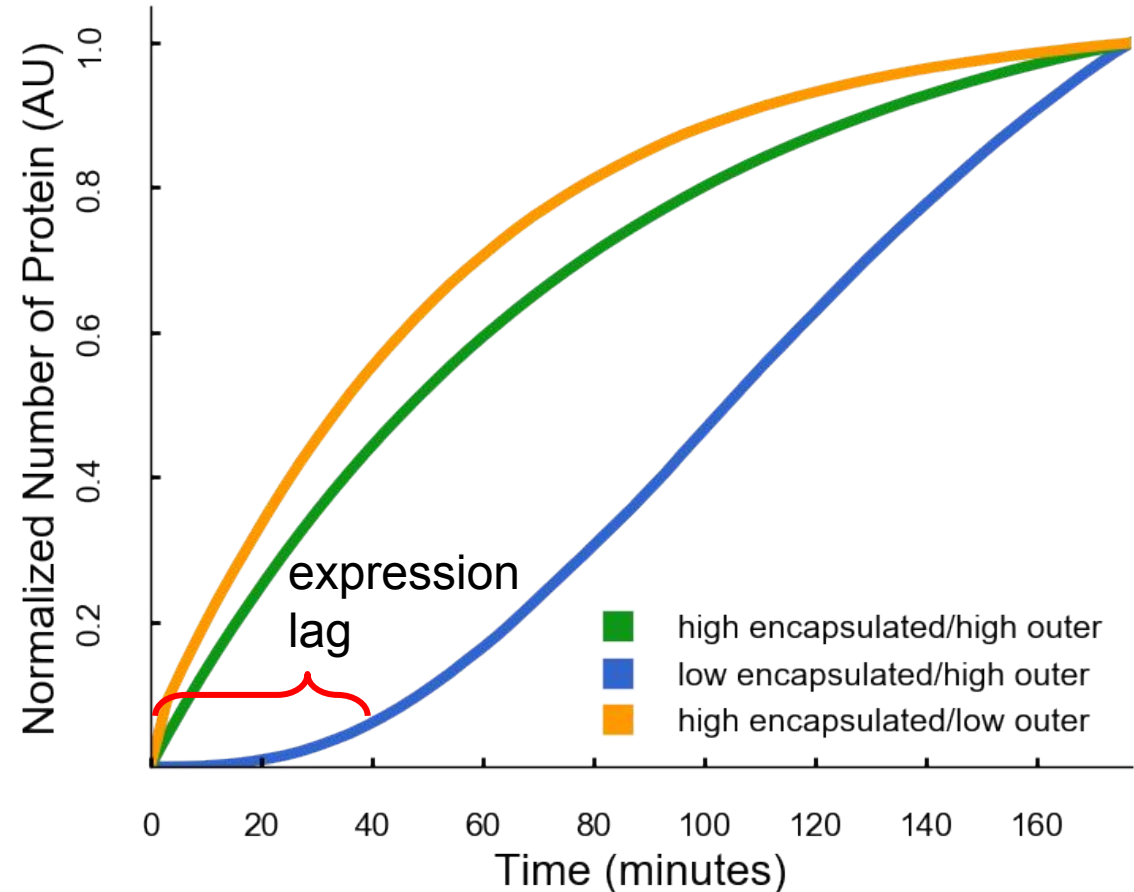

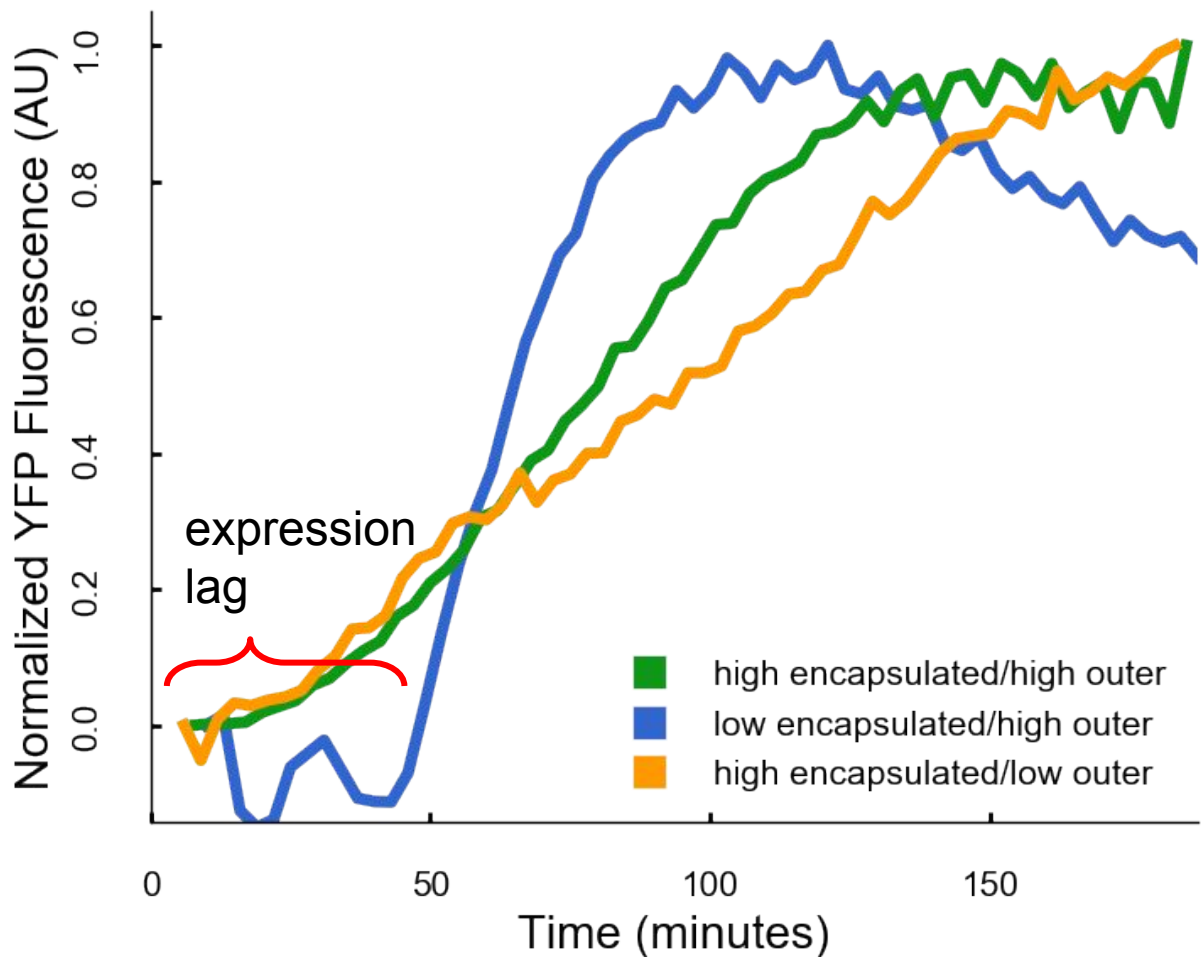

Protein expression dependent upon both encapsulated and outer resources

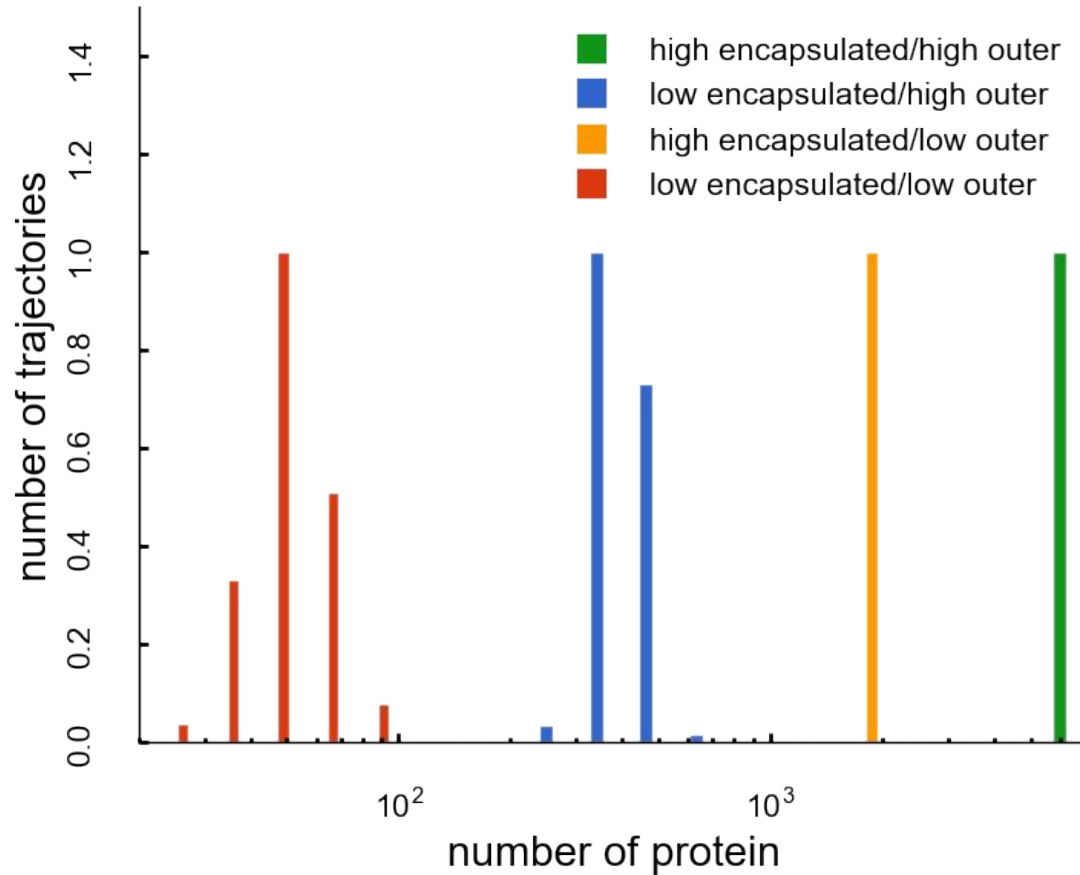

Membrane permeabilization results in a lag in expression

Resource transport delays protein expression

Model predicts greatly reduced mean protein

low encapsulated

high encapsulated

Resource concentrations control mean protein

Chapter 3 Summary

1. Small resources cross permeabilized membranes
2. Photo-treatment can increase protein expression in vesicles.
3. Photo-treatment makes protein expression more uniform.
4. Resource transport across the membrane delays protein expression

Outline

Chapter 1: Introduction

Chapter 2: Resource Sharing Controls Gene Expression Bursting

Chapter 3: Controlling Cell-Free Gene Expression Behavior by Tuning Membrane Transport Properties

Chapter 4: Conclusion

Chapter 4: Conclusion

Conclusions

1. Larger resource pools contribute to existing expression centers instead of nucleating new centers
2. Vesicle membranes can be made permeable to small expression resources
3. Permeabilized membranes result in higher average protein expression and more uniform expression
4. Membrane permeabilization delays protein expression
